

# SPAGYRIC EXTRACTION PROCESS

Spagyria is a 500+ year old branch of alchemy that creates a more potent, bio-available, and mineral rich extract of plants and fungi.

We carefully extract our plants and fungi with a series of alcohol and water portions, under vacuum to allow for distillation at a low temperature.

After the initial extractions are complete, the spent plant matter is burned down to a white ash, calcined, and through a special process, purified mineral salts are formed. These minerals are then reunited with the alcohol portion of the extract to react and form new compounds.

Purified Mineral Salts

The reuniting moment is special and we incorporate the sacred vibrations of the gong, with positive intentions.

Spagyric tinctures can be easily absorbed into our bodies without the need for additional digestion.

The title Spagyric is derived from the ancient Greek words spao (to draw out) and agerio (to gather). This term highlights the basic technique underlying the many forms of Spagyric medicines: Separate, purify and recombine.

It's central blueprint, the Tria Prima, states that all things are composed of three parts: Salt, Sulphur and Mercury.

For plants and fungi, the three essentials include:

- ⊖ Mineral salt profile- Salt / Physical Body
- ⚱ Essential oil and active compound profile- Sulphur / Soul or Emotional Body
- ☿ Alcohol potential - Mercury / Spirit or Mental Body
